### ABSTRACT

The reaction of *N,N'*-(1,4-phenylene)bis(2-cyanoacetamide) (1) with phenyl isothiocyanate gave thiocarbamoyl derivative 3, which reacted with  $\alpha$ -halocarbonyl compounds in a mixture of ethanol:*N,N*-dimethylformamide in the presence of triethylamine to afford thiazoles 4, 7, 10 and thiophene derivatives. While, when the same reaction was refluxed in a mixture of ethanol:*N,N*-dimethylformamide only afforded the acyclic compounds 5, 6, 8, 9 and 11, which when refluxed in *N,N*-dimethylformamide in presence of triethylamine gave the corresponding above thiazole and thiophene derivatives. Moreover, the reaction of compound 3 with dihalo compounds afforded cyclic dithio derivatives 13a, 13b and 14. The newly synthesized compounds were characterized by analytical, spectral data and evaluation of their antimicrobial activities of 4, 7, 14 and 15 have a high antimicrobial activity.

### 1. Introduction

Aryl isothiocyanates are versatile reagents that have been used as synthetic intermediates to prepare biologically active heterocyclic compounds [1]. The diversity of biological and physiological activities of several organic sulfur heterocycles may be attributed to the presence of the N=C=S fragment, characteristic of thiazoles, thiazolines and thiazolidines [2]. These are known to exhibit pesticidal [3], anticonvulsant [4], nematocidal [5], herbicidal [6], antiviral [7], fungicidal [8], bactericidal [9,10], antiprotozoal [11], and hypoglycemic activity [12]. They also act as chemotherapeutic agents. This encouraged us to design a specific program aimed at the synthesis of several new derivatives of these ring systems.

The present work outlines the chemistry of thiocarbamoyl derivatives not all but the most important in the synthesis of heterocyclic compounds. The vast majority of thiocarbamoyl derivatives have been the subject of many studies, for the preparation of potentially biologically active compounds and for some industrial uses [13-15]. In this work, the utility of the title compounds in heterocyclic synthesis has been studied.

We have been particularly interested to study if reactions of such thiocarbamoyl might be extended to include a more general synthesis of other classes of organic compounds and its utility as synthetic intermediate for the synthesis of new heterocyclic compounds. The present work, reports on the

synthesis of several new thiazole and thiophene derivatives by the reaction of thiocarbamoyl of the type 3 with compounds containing an active methylene group in the presence of a base. Reactions of this type have not been reported previously, but were found to give products in excellent yields under very mild conditions.

Moreover, in continuation of the previously reported work [16,17] the resulting thiazole and thiophene derivatives have latent functional substituents, which have potential for further chemical transformations and new routes for the preparation of substituted thiazole and thiophene derivatives. Now, we have extended our synthetic program to the synthesis of otherwise inaccessible heterocyclic ring system, utilizing phenyl isothiocyanate as a key starting material. It is known that a great variety of reactants bearing the N=C=S fragment undergo cyclization on reaction with  $\alpha$ -halocarbonyl compounds to afford thiophenes [18-22], thiazoles, 2,3-dihydro thiazoles [4], which have been shown to exhibit antiprotozoal [11], and fungicidal properties [8].

### 2. Experimental

#### 2.1. Instrumentation

All melting points are recorded on Gallenkamp electric melting point apparatus and are uncorrected.

The IR spectra (KBr) were recorded on Perkin Elmer Infrared Spectrophotometer Model 157, Grating. The  $^1\text{H}$  and  $^{13}\text{C}$  NMR spectra were run on Varian Spectrophotometer at 300 and 75 MHz, respectively, using tetramethylsilane (TMS) as an internal reference and  $\text{DMSO}-d_6$  as solvent. The mass spectra (EI) were recorded on 70 eV with Kratos MS equipment and/or a Varian MAT 311 A spectrometer. Elemental analyses (C, H and N) were carried out at the micro analytical center of Cairo University, Giza, Egypt, the results were found to in good agreement ( $\pm 0.3\%$ ) with the calculated values.

## 2.2. Synthesis

### 2.2.1. Synthesis of (2z,2'z)-N,N'-(1,4-phenylene)bis(2-cyano-3-mercapto-3-(phenylamino)acrylamide) (3)

To a solution of compound **1** (2.4 g, 0.01 mol), in DMF (30 mL), and phenyl isothiocyanate (3 mL, 0.02 mol) in presence of NaOEt (formed from 0.4g Na + 20 mL EtOH), was stirred overnight at room temperature to give compound **2** as non-soluble salt. The reaction mixture was poured onto crushed ice and neutralized by dilute HCl. The obtained solid product was collected by filtration, washed, dried and crystallized from ethanol to give compound **3** (Scheme 1). Color: Green powder. Yield: 90%. M.p.: 198 °C. IR (KBr,  $\nu$ ,  $\text{cm}^{-1}$ ): 3291 (NHCO), 3043 (NHPH), 2185 (CN), 1593 (C=O), 1233 (C=S).  $^1\text{H}$  NMR (300 MHz,  $\text{DMSO}-d_6$ ,  $\delta$ , ppm): 3.84 (s, 2H, -2SH-), 4.25 (s, 2H, 2NHPH), 7.02-7.78 (m, 14H, Ar-H), 9.75 (s, 2H, 2NHCO).  $^{13}\text{C}$  NMR (75 MHz,  $\text{DMSO}-d_6$ ,  $\delta$ , ppm): 171 (2C, C-SH), 161 (2C, CO), 138 (2C, Ar-C), 133 (2C, Ar-C), 131 (2C, Ar-C), 129 (2C, Ar-C), 126 (2C, Ar-C), 124 (2C, Ar-C), 123 (2C, Ar-C), 120 (4C, Ar-C), 118 (2C, CN), 88 (2C, C-CN). LC-MS ( $m/z$ , %): 512 ( $\text{M}^+$ , 58), 470 (58), 462 (56), 349 (96), 333 (42), 273 (47), 226 (87), 206 (100), 200 (89), 174 (33), 136 (17), 115 (48), 94 (56), 65 (43), 52 (26). Anal. calcd. for  $\text{C}_{26}\text{H}_{20}\text{N}_6\text{O}_2\text{S}_2$  (512.11): C, 60.92; H, 3.93; N, 16.39; O, 6.24; S, 12.51. Found: C, 60.85; H, 3.90; N, 16.46; O, 6.26; S, 12.52%.

### 2.2.2. Synthesis of (2z,2'z)-N,N'-(1,4-phenylene)bis(2-cyano-2-(3,4-diphenylthiazol-2(3H)-ylidene)acetamide) (4)

**Method A** : A solution of compound **3** (5.12 g, 0.01 mol), in a mixture of EtOH:DMF (2:1, v:v) (30 mL), and phenacyl bromide (4 g, 0.02 mol), in presence of triethylamine (4 drops), was refluxed for 4 h. The reaction mixture was allowed to cool,

poured onto crushed ice. The obtained solid product was collected by filtration, washed, dried and crystallized from ethanol to give compound **4** (Scheme 2).

**Method B** : A solution of compound **5** (7.48 g, 0.01 mol), in DMF (30 mL), in presence of triethylamine (4 drops), was refluxed 4 h. The reaction mixture was poured onto crushed ice. The obtained solid product was collected by filtration, washed, dried and crystallized from ethanol to give compound **4**.

(2z,2'z)-N,N'-(1,4-phenylene)bis(2-cyano-2-(3,4-diphenylthiazol-2(3H)-ylidene)acetamide) (**4**): Color: Brown powder. Yield: 90%. M.p.: 272 °C. IR (KBr  $\nu/\text{cm}^{-1}$ ): 3284 (NH), 3054 ( $\text{CH}_2$ ), 2170 (CN), 1581 (CONH), 1552 (C=C).  $^1\text{H}$ NMR (300 MHz,  $\text{DMSO}-d_6$ ,  $\delta$ , ppm): 6.23 (s, 2H, 2 $\text{CH}_{\text{thiazole}}$ ), 7.23-7.45 (m, 20H, Ar-H), 7.33-7.46 (dd, 4H, Ar-H AB system), 9.50 (s, 2H, 2NHCO). LC-MS ( $m/z$ , %): 712 ( $\text{M}^+$ , 2), 689 (2), 454 (2), 428 (5), 368 (7), 343 (5), 319 (8), 294 (95), 276 (24), 217 (24), 134 (31), 77 (100). Anal. calcd. for  $\text{C}_{42}\text{H}_{28}\text{N}_6\text{O}_2\text{S}_2$  (712.17): C, 70.77; H, 3.96; N, 11.79; O, 4.49; S, 9.00. Found: C, 70.69; H, 4.00; N, 11.81; O, 4.50; S, 9.01%.

### 2.2.3. Synthesis of (2Z,2'Z)-N,N'-(1,4-phenylene)bis(2-cyano-3-((2-oxo-2-phenylethyl)thio)-3-(phenylamino)acrylamide) (5), (2Z,2'Z)-N,N'-(1,4-phenylene)bis(2-cyano-3-((cyano methyl)thio)-3-(phenylamino)acrylamide) (9) and (2Z,2'Z)-N,N'-(1,4-phenylene)bis(2-cyano-3-((2-oxopropyl)thio)-3-(phenylamino)acrylamide) (11)

**General procedure** : A solution of compound **2** (0.01 mol), in a mixture of EtOH:DMF (2:1, v:v) (30 mL), and phenacyl bromide (4 g, 0.02 mol) and/or chloroacetonitrile (1.4 g, 0.02 mol) and/or chloroacetone (1.5 g, 0.02 mol) was stirred 4-6 h. The reaction mixture was poured onto crushed ice. The obtained solid product was collected by filtration, washed, dried and crystallized from ethanol to give compounds **5**, **9** and **11**, respectively (Scheme 2).

(2Z,2'Z)-N,N'-(1,4-phenylene)bis(2-cyano-3-((2-oxo-2-phenylethyl)thio)-3-(phenylamino)acrylamide) (**5**): Color: Yellow powder. Yield: 30%. M.p.: 185 °C. IR (KBr,  $\nu$ ,  $\text{cm}^{-1}$ ): 3295 (NH), 2925 ( $\text{CH}_2$ ), 2186 (CN), 1649 (CONH), 1599 (C=C).  $^1\text{H}$ NMR (300MHz,  $\text{DMSO}-d_6$ ,  $\delta$ , ppm): 3.72 (s, 2H, 2NHPH), 4.30 (s, 4H, 2 $\text{CH}_2$ ), 7.23-7.62 (m, 20H, Ar-H), 7.31-7.45 (dd, 4H, Ar-H AB system), 9.70 (s, 2H, 2NHCO).

Scheme 2

$^{13}\text{C}$  NMR (75 MHz, DMSO- $d_6$ ,  $\delta$ , ppm): 192 (2C, CO-Ph), 171 (2C, C-S), 162 (2C, CO-NH), 136 (4C, Ar-C), 133 (4C, Ar-C), 129 (4C, Ar-C), 126 (4C, Ar-C), 124 (4C, Ar-C), 123 (4C, Ar-C), 122 (2C, Ar-C), 120 (4C, Ar-C), 118 (2C, CN), 71 (2C, C-CN), 38 (2C, CH<sub>2</sub>-S). LC-MS ( $m/z$ ): 748 ( $M^+$ , 20), 746 (4), 713 (4), 680 (4), 391 (4), 327 (6), 276 (36), 172 (11), 135 (19), 77 (100). **2.2.5. Synthesis of (2*Z*,2'*Z*)-*N,N'*-(1,4-phenylene)bis(2-cyano-2-(4-oxo-3-phenylthiazolidin-2-ylidene)acetamid) (**7**)**

**Method A:** A solution of compound **3** (5.12 g, 0.01 mol), in a mixture of EtOH:DMF (2:1, v:v) (30 mL), and chloroacetyl chloride (1.6 mL, 0.02 mol) and/or ethyl chloroacetate (1.75 mL, 0.02 mol) and/or ethyl bromoacetate (2.3 mL, 0.02 mol) and/or chloroacetic acid (1.35 mL, 0.02 mol), in the presence of triethylamine (4 drops), was refluxed for 4 h (Scheme 3).

Scheme 3

The reaction mixture was allowed to cool, poured onto crushed ice. The obtained solid product was collected by filtration, washed, dried and crystallized from ethanol to give compound **7**.

**Method B:** A solution of compound **6** or **8** (0.01 mol), in DMF (30 mL), in presence of triethylamine (4 drops), was refluxed 4 h. The reaction mixture was poured onto crushed ice. The obtained solid product was collected by filtration, washed, dried and crystallized from ethanol to give compound **7**.

*(2Z,2'Z)-N,N'-(1,4-phenylene)bis(2-cyano-2-(4-oxo-3-phenylthiazolidin-2-ylidene)acetamid)* (**7**): Color: Brown powder. Yield: 90%. M.p.: 247 °C. IR (KBr,  $\nu$ ,  $\text{cm}^{-1}$ ): 3401 (NH), 2194 (CN), 1735 (CO), 1656 (CONH).  $^1\text{H}$  NMR (300 MHz,  $\text{DMSO}-d_6$ ,  $\delta$ , ppm): 3.97 (s, 4H, 2CH<sub>2</sub>), 7.23-7.55 (m, 14H, Ar-H), 9.28 (s, 2H, 2NHCO). LC-MS ( $m/z$ ): 592 (M<sup>+</sup>, 2), 458 (2), 448 (4), 431 (2), 422 (6), 404 (2), 375 (8), 350 (9), 271 (4), 215 (35), 143 (28), 134 (42), 93 (59), 77 (100). Anal. calcd. for C<sub>30</sub>H<sub>20</sub>N<sub>6</sub>O<sub>4</sub>S<sub>2</sub> (592.10): C, 60.80; H, 3.40; N, 14.18; O, 10.80; S, 10.82. Found: C, 60.74; H, 3.42; N, 14.20; O, 10.78; S, 10.86%.

#### 2.2.6. Synthesis of *(2Z,2'Z)-N,N'-(1,4-phenylene)bis(2-(4-amino-3-phenylthiazol-2(3H)-ylidene)-2-cyanoacetamide)* (**10**)

**Method A:** A solution of compound **3** (5.12 g, 0.01 mol) in a mixture of EtOH:DMF (2:1, v:v) (30 mL) containing few drops of triethylamine (4 drops) was treated with chloroacetonitrile (1.4 g, 0.02 mol). The reaction mixture was refluxed for 6 h, and allowed to cool, poured onto crushed ice. The solid product was collected by filtration, washed, dried and crystallized from ethanol to give compound **10** (Scheme 4).

**Method B:** A solution of compound **9** (5.9 g, 0.01 mol), in DMF (30 mL), in presence of triethylamine (4 drops), was refluxed 6 h. The reaction mixture was poured onto crushed ice. The obtained solid product was collected by

filtration, washed, dried and crystallized from ethanol to give compound **10**.

*(2Z,2'Z)-N,N'-(1,4-phenylene)bis(2-(4-amino-3-phenylthiazol-2(3H)-ylidene)-2-cyanoacetamide)* (**10**): Color: Green powder. Yield: 78%. M.p.: 270 °C. IR (KBr,  $\nu$ ,  $\text{cm}^{-1}$ ): 3399 (NH), 2197 (CN), 1650 (CO).  $^1\text{H}$  NMR (300 MHz,  $\text{DMSO}-d_6$ ,  $\delta$ , ppm): 1.21 (s, 4H, 2NH<sub>2</sub>), 4.11 (s, 2H, 2CH), 7.02-7.56 (m, 14H, Ar-H), 9.63 (s, 2H, 2NHCO). LM-CS ( $m/z$ ): 590 (M<sup>+</sup>, 10), 538 (2), 451 (24), 374 (17), 348 (18), 266 (10), 215 (13), 174 (11), 134 (59), 127 (12), 77 (100). Anal. calcd. for C<sub>30</sub>H<sub>22</sub>N<sub>8</sub>O<sub>2</sub>S (590.13): C, 61.00; H, 3.75; N, 18.97; O, 5.42; S, 10.86. Found: C, 60.95; H, 3.77; N, 18.95; O, 5.45; S, 10.88%.

#### 2.2.7. Synthesis of *N,N'-(1,4-phenylene)bis(5-acetyl-4-amino-2-(phenylamino)thiophene-3-carboxamide)* (**12**)

**Method A:** A solution of compound **3** (5.12 g, 0.01 mol) in a mixture of EtOH:DMF (2:1, v:v) (30 mL) containing few drops of triethylamine (4 drops) was treated with chloroacetone (1.5 g, 0.02 mol). The reaction mixture was refluxed for 4h, allowed to cool, poured onto crushed ice. The solid product was collected by filtration, washed, dried and crystallized from ethanol to give compound **12** (Scheme 5).

**Method B:** A solution of compound **11** (6.26g, 0.01 mol), in DMF (30 mL), in presence of triethylamine (4 drops), was refluxed 4 h. The reaction mixture was poured onto crushed ice. The obtained solid product was collected by filtration, washed, dried and crystallized from ethanol to give compound **12**.

*N,N'-(1,4-phenylene)bis(5-acetyl-4-amino-2-(phenylamino)thiophene-3-carboxamide)* (**12**): Color: Brown powder. Yield: 70%. M.p.: 234 °C. IR (KBr,  $\nu$ ,  $\text{cm}^{-1}$ ): 3270 (NH), 2191 (CN), 1743 (COCH<sub>3</sub>), 1660 (CONH).  $^1\text{H}$  NMR (300 MHz,  $\text{DMSO}-d_6$ ,  $\delta$ , ppm): 2.50 (s, 6H, 2CH<sub>3</sub>), 7.11 (s, 4H, 2NH<sub>2</sub>), 7.36-7.63 (m, 14H, Ar-H), 9.72 (s, 2H, 2NHPh), 9.78 (s, 2H, 2NHCO).

LM-CS (*m/z*): 624 (M<sup>+</sup>, 9), 376 (2), 350 (4), 338 (9), 277 (4), 257 (7), 243 (11), 232 (83), 217 (10), 189 (16), 135 (19), 108 (46), 77 (70). Anal. calcd. for C<sub>32</sub>H<sub>28</sub>N<sub>6</sub>O<sub>4</sub>S<sub>2</sub> (624.16): C, 61.52; H, 4.52; N, 13.45; O, 10.24; S, 10.27. Found: C, 61.45; H, 4.54; N, 13.48; O, 10.25; S, 10.28%.

### 2.2.8. Synthesis of (2*z*,2'*z*)-*N,N'*-(1,4-phenylene)bis(2-cyano-3-(methylthio)-3-(phenylamino)acrylamide) derivatives (13a, 13b and 14)

To a solution of compound 2 (0.01 mol), in DMF (30 mL) in presence of alcoholic KOH (10%) (formed from 0.56 g KOH + 100 mL EtOH), 1,3-dibromopropane (2 mL, 0.02 mol) or 1,4-dibromobutane (2.2 mL, 0.02 mol) or 1,2-bis(bromomethyl) benzene (2.6 mL, 0.02 mol) was added and stirred overnight at room temperature. The reaction mixture was poured onto crushed ice. The obtained solid product was collected by filtration, washed, dried and crystallized from ethanol to give compounds 13a, 13b, 14, respectively (Scheme 6).

(4*Z*,11*Z*)-3,13-dioxo-5,11-bis(phenylamino)-6,10-dithia-2,14-diaza-1(1,4)-benzenacyclotetradecaphane-4,11-diene-4,12-dicarbonitrile (13a): Color: Green powder. Yield: 90%. M.p.: 170 °C. IR (KBr, v, cm<sup>-1</sup>): 3303 (NHPh), 3284 (NHCO), 2192 (CN), 1660 (CO). <sup>1</sup>H NMR (300 MHz, DMSO-*d*<sub>6</sub>, δ, ppm): 1.72-1.93 (m, 2H, CH<sub>2</sub>), 3.40 (t, 4H, 2CH<sub>2</sub>S), 3.68 (s, 2H, 2NHPh), 7.21-7.55 (m, 14H, Ar-H), 9.56 (s, 2H, 2NHCO). LM-CS (*m/z*): 552 (M<sup>+</sup>, 40), 558 (20), 333 (25), 214 (25), 160 (33), 143 (29), 125 (37), 106 (37), 99 (29), 93 (83), 79 (41), 76 (79), 60 (100). (4*Z*,11*Z*)-3,13-dioxo-5,11-bis(phenylamino)-6,10-dithia-2,14-diaza-1(1,4),8(1,2)-dibenzenacyclotetradecaphane-4,11-diene-4,12-dicarbonitrile (14): Color: Green powder. Yield: 91%. M.p.: 197 °C. IR (KBr, v, cm<sup>-1</sup>): 3401 (NHPh), 3259 (NHCO), 2192 (CN), 1660 (CO). <sup>1</sup>H NMR (300 MHz, DMSO-*d*<sub>6</sub>, δ, ppm): 3.86 (s, 4H, 2CH<sub>2</sub>-), 7.14-7.40 (m, 14H, Ar-H), 7.60 (d, 4H, Ar-H, AB system), 9.51 (s, 2H, 2NHPh), 11.65 (s, 2H, 2NHCO). LM-CS (*m/z*): 614 (M<sup>+</sup>, 7), 578 (5), 169 (24), 141 (19), 135 (24), 126 (24), 105 (38), 93 (90), 80 (100), 67 (47). Anal. calcd. for C<sub>34</sub>H<sub>26</sub>N<sub>6</sub>O<sub>2</sub>S<sub>2</sub> (614.16): C, 66.43; H, 4.26; N, 13.67; O, 5.21; S, 10.43. Found: C, 66.36; H, 4.29; N, 13.69; O, 5.24; S, 11.42%.

### 2.2.9. Synthesis of (2*z*,2'*z*)-*N,N'*-(1,4-phenylene)bis(2-cyano-3-(2,6-diaminopyrimidin-4-ylthio)-3-(phenylamino)acrylamide) (15)

To a solution of compound 2 (0.01 mol), in a mixture of DMF:acetone (1:2, v:v) (30 mL), in presence of potassium carbonate (1.38 g, 0.01 mol), and 6-chloro-2,4-diaminopyrimidine (3 mL, 0.02 mol) was refluxed 5 h. The reaction mixture was allowed to cool, poured onto crushed ice. The obtained solid product was collected by filtration, washed, dried and crystallized from ethanol to give compound 15 (Scheme 6). Color: Green powder. Yield: 73%. M.p.: 155 °C. IR (KBr, v, cm<sup>-1</sup>): 3397 (NH<sub>2</sub>), 3315 (NH<sub>2</sub>), 3282 (NHPh), 3195 (NHCO), 2927 (CH), 2192 (CN), 1644 (CO). <sup>1</sup>H NMR (300 MHz, DMSO-*d*<sub>6</sub>, δ, ppm): 4.10 (s, 2H, 2NHPh), 5.86 (s, 2H, 2CH-pyrimidine), 6.55-6.65 (sb, 8H, 4NH<sub>2</sub>), 7.02-7.50 (m, 14H, Ar-H), 9.65 (s, 2H, 2NHCO). LM-CS (*m/z*): 728 (M<sup>+</sup>, 13), 724 (2), 302 (2), 235 (6), 216 (3), 150 (11), 135 (27), 119 (27), 93 (100), 77 (61), 65 (36). Anal. calcd. for C<sub>34</sub>H<sub>28</sub>N<sub>14</sub>O<sub>2</sub>S<sub>2</sub> (728.20): C, 56.03; H, 3.87; N, 26.91; O, 4.39; S, 8.80. Found: C, 55.93; H, 3.89; N, 26.95; O, 4.41; S, 8.82%.

### 2.3. Antimicrobial studies

The disks of Whatman filter paper were prepared with standard size (5.0 mm diameter) and kept into 1.0 oz screw capped wide mouthed containers for sterilization. These bottles are kept into hot air oven at temperature of 150 °C. Then, the standard sterilized filter paper disks impregnated with a solution of the test compound in DMF (1 mg/mL) were placed on nutrient agar plate seeded with the appropriate test organism in triplicates.

Scheme 5

Standard concentrations of  $10^6$  CFU/mL (Colony Forming U/mL) and  $10^4$  CFU/mL were used for antibacterial and antifungal assay, respectively. Pyrex glass Petri dishes (9 cm in diameter) were used and two disks of filter paper were inoculated in each plate. The utilized test organisms were: *B. subtilis* and *B. thuringiensis* as examples of Gram-positive bacteria and *E. coli* and *P. aeruginosa* as examples of Gram-negative bacteria. They were also evaluated for their in vitro antifungal potential against *F. oxysporum* and *B. fabae* fungal strains. Chloramphenicol, cephalothin and cycloheximide were used as standard antibacterial and antifungal agents, respectively. DMF alone was used as control at the same above-mentioned concentration and due this there was no visible change in bacterial growth. The plates were incubated at  $37^\circ\text{C}$  for 24 h for bacteria and for 48 h for fungi. Compounds that showed significant growth inhibition zones ( $>14$  mm) using the twofold serial dilution technique, were further evaluated for their minimal inhibitory concentrations (MICs).

#### 2.4. Minimal inhibitory concentration (MIC) measurement

The microdilution susceptibility test in Müller-Hinton Broth (Oxoid) and Sabouraud Liquid Medium (Oxoid) were used for the determination of antibacterial and antifungal activity, respectively. Stock solutions of the tested compounds, Chloramphenicol, cephalothin and cycloheximide were prepared in DMF at concentration of 1000 mg/mL. Each stock solution was diluted with standard method broth to prepare serial twofold dilutions in the range of 500-3.125 mg/mL 10 mL of the broth containing about  $10^6$  CFU/mL of test bacteria was added to each well of 96-well microtiter plate. The sealed microplates were incubated at  $37^\circ\text{C}$  for 24 h for antibacterial activity and at  $37^\circ\text{C}$  for 48 h for antifungal activity in a humid chamber. At the end of the incubation period, the minimal inhibitory concentrations (MIC) values were recorded as the lowest concentrations of the substance that had no visible turbidity. Control experiments with DMF and uninoculated media were run parallel to the test compounds under the same conditions.

### 3. Results and discussion

#### 3.1. Chemistry

In this work, we describe generally applicable extension of this synthetic approach, first was reported by Hantzsch and Weber [23]. Thus, the base catalyzed reaction of the acidic methylene compound 1 with phenyl isothiocyanate in dry *N,N*-dimethylformamide at room temperature in basic medium led to the formation of the non- isolable intermediate 2 which gave thiocarbamoyl derivative 3 upon treatment with dilute HCl (Scheme 1).

Assignment of the product 3 was based on elemental and spectral analysis. The IR spectrum showed absorption bands at 3403, 3291, 2185, 1593 and  $1233\text{ cm}^{-1}$  attributable to the NHPH, amidic NH, CN, C=O and C=S functions, respectively. Its  $^1\text{H}$  NMR spectrum revealed two singlet signals at  $\delta$  3.84 and 4.25 ppm for CH and NHPH protons, multiplet signals at  $\delta$  7.02-7.78 ppm for aromatic protons and singlet signal at  $\delta$  9.75 ppm for NH proton.

Compound 3 also undergoes cyclization upon the reaction with phenacyl bromide in a mixture of ethanol and *N,N*-dimethylformamide (2:1) in presence of catalytic amount of triethylamine yielded a product 4, which analyzed correctly for  $\text{C}_{42}\text{H}_{28}\text{N}_6\text{O}_2\text{S}_2$ . The structure 4 was inferred from its correct spectral data. Thus, the IR spectrum showed absorption bands at 3284, 2170, 1581 and  $1552\text{ cm}^{-1}$  corresponding to NH, CN, CO and C=C functions, respectively. Its  $^1\text{H}$  NMR spectrum revealed singlet signal at  $\delta$  6.23 ppm for CH, multiplet signals at  $\delta$  7.23-7.45 ppm for aromatic protons and singlet signal at  $\delta$  9.60 ppm for NH proton. The structure of 4 was also confirmed by its mass spectrum which showed the molecular ion peak at  $m/z = 712$  ( $\text{M}^+$ , 90%) corresponding to the molecular formula  $\text{C}_{42}\text{H}_{28}\text{N}_6\text{O}_2\text{S}_2$ . Based on the forgoing data, structure 4 was assigned to this product. The structure 4 was further confirmed by alternative synthesis. Thus, it was found that, stirring of 2 with phenacyl bromide in a mixture of ethanol and *N,N*-dimethylformamide (2:1) at room temperature afforded the acyclic intermediate 5 by HBr elimination. Structure 5 was suggested for the reaction product on the basis of both elemental and spectral analyses. The IR spectrum showed absorption bands at 3295, 2186, 1649 and  $1599\text{ cm}^{-1}$  corresponding to NH, CN, CO and C=C functions, respectively. Its  $^1\text{H}$ -NMR spectrum revealed two singlet signal at  $\delta$  3.72 and 4.30 ppm for NHPH and  $\text{CH}_2$ , multiplet signals at  $\delta$  7.23-7.62 ppm for aromatic protons and singlet signal at  $\delta$  9.70 ppm for NH proton.

Scheme 6

The structure of compound 5 was confirmed also by its mass spectrum which showed a peak at  $m/z = 746$  ( $M^+ - 2$ , 30%).

Refluxing of compound 5 in *N,N*-dimethylformamide with few drops of triethylamine led to the formation of a product identical in all respects (M.p., mixed m.p., IR and  $^1\text{H}$  NMR) to 4 (Scheme 2).

When the compound 3 was treated with ethyl chloroacetate or with ethyl bromoacetate or with chloroacetic acid or with chloroacetyl chloride in a mixture of ethanol and *N,N*-dimethylformamide (2:1) with few drops of triethylamine, a product 7 that analyzed for  $\text{C}_{30}\text{H}_{20}\text{N}_6\text{O}_4\text{S}_2$  was isolated in each case in good yield. While, the reaction of the intermediate 2 with ethyl chloroacetate or with ethyl bromoacetate or with chloroacetic acid in mixture of *N,N*-dimethylformamide and ethanol (1:2) led to the formation of compound 6. The acyclic structure 6 was established based on its IR spectrum that showed absorption bands at 3401, 3322, 2200, 1735, 1660 and  $1594\text{ cm}^{-1}$  attributable to the NPh, amidic NH, CN, COOEt, CONH and C=C functions, respectively. Its  $^1\text{H}$  NMR spectrum revealed triplet signal at  $\delta$  1.21 ppm for  $\text{CH}_3$ , two singlet signals at  $\delta$  3.92 and 4.00 ppm for NPh and  $\text{CH}_2\text{S}$ , quartet signal at  $\delta$  4.18 ppm for  $\text{CH}_2$ , multiplet signals at  $\delta$  7.06-7.61 ppm for aromatic protons and singlet signal at  $\delta$  9.69 ppm amidic NH protons. Refluxing of 6 in *N,N*-dimethylformamide and a catalytic amount of triethylamine afforded the corresponding thiazole derivative 7. Structure 7 was confirmed on the basis of its elemental and spectral data. The IR spectrum showed bands at 3401, 2194, 1735 and  $1656\text{ cm}^{-1}$  attributable to the amidic NH, CN, CO and CONH functions, respectively. Its  $^1\text{H}$  NMR spectrum revealed singlet signal at  $\delta$  3.97 ppm for  $\text{CH}_2$  protons, multiplet signals at  $\delta$  7.23-7.55 ppm for aromatic protons and singlet signal at  $\delta$  9.28 ppm for NH proton. The structure of compound 7 was confirmed also by its mass spectrum which showed a peak at  $m/z = 592$  ( $M^+$ , 90%).

The intermediate 2 reacted with chloroacetyl chloride in stirring *N,N*-dimethylformamide and ethanol (1:2), a product 8 that analyzed for  $\text{C}_{30}\text{H}_{22}\text{N}_6\text{O}_4\text{S}_2\text{Cl}_2$  was isolated in good yield. The acyclic structure 8 was established based on its IR spectrum that showed bands at 3408, 3318, 2194, 1745 and  $1655\text{ cm}^{-1}$  related to NPh, NH, CN, COCl and CONH function groups, respectively. Its  $^1\text{H}$  NMR spectrum revealed two singlet signals at  $\delta$  3.82 and 4.00 ppm for NPh and  $\text{CH}_2$  protons, multiplet signals at  $\delta$  7.20-7.63 ppm for aromatic protons and singlet signal at  $\delta$  9.55 ppm for amidic NH proton. The structure of compound 8 was confirmed by its mass spectrum which showed a peak at  $m/z = 664$  ( $M^+$ , 50%).

Refluxing of compound 8 in *N,N*-dimethylformamide and a catalytic amount of triethylamine led to the formation of a product identical in all respects (M.p., mixed m.p., IR and  $^1\text{H}$  NMR) to compound 7 (Scheme 3).

Similarly, when the intermediate sodium salt 2 is stirred with chloroacetonitrile in a mixture of ethanol and *N,N*-dimethylformamide (2:1) at room temperature the corresponding acyclic intermediate 9 is exclusively isolated in good yield. The structure of 9 has been confirmed on the basis of elemental and spectral data. The IR spectrum exhibits bands at 3407, 2923, 2193, 1656 and  $1606\text{ cm}^{-1}$  related to the NPh, NH, CN, CO and C=C function groups, respectively. Its  $^1\text{H}$  NMR spectrum revealed two singlet signals at  $\delta$  3.90 and 4.11 ppm corresponding to NPh and  $\text{CH}_2$  protons, multiplet signals at  $\delta$  7.02-7.71 ppm for aromatic protons and singlet signal at  $\delta$  9.63 ppm corresponding to amidic NH proton. The correct structure of compound 9 was also confirmed by its mass spectrum which showed a peak at  $m/z = 591$  ( $M^+ + 1$ , 20%). Furthermore, refluxing of the acyclic intermediate 9 in *N,N*-dimethylformamide containing a catalytic amount of triethylamine afforded the thiazole derivative 10. The thiazole derivative 10 was established based on its IR spectrum which showed bands at 3399, 2197 and  $1650\text{ cm}^{-1}$  related to the amidic NH, CN and

CO function groups, respectively. Its  $^1\text{H-NMR}$  spectrum revealed two singlet signals at  $\delta$  1.21 and 4.11 ppm for  $\text{NH}_2$  and CH protons, multiplet signals at  $\delta$  7.02 -7.56 ppm for aromatic protons and singlet signal at  $\delta$  9.76 ppm for NH proton. The correct structure of compound **10** was also confirmed by its mass spectrum which showed a peak at  $m/z = 590$  ( $\text{M}^+$ , 78%). On the other hand, it has been found that compound **10** is directly formed by refluxing compound **3** with chloroaceto nitrile in a mixture of ethanol and *N,N*-dimethylformamide (2:1) and in presence of catalytic amount of triethylamine (Scheme 4).

Stirring of compound **2** with chloroacetone in a mixture of ethanol and *N,N*-dimethylformamide (2:1) at room temperature to afford the acyclic intermediate **11** by NaCl elimination. The acyclic intermediate **11** was established based on its IR spectrum which showed bands at 3279, 2924, 2184, 1723 and 1644  $\text{cm}^{-1}$  corresponding to NH, CH, CN,  $\text{COCH}_3$  and CONH function group, respectively. Its  $^1\text{H NMR}$  spectrum revealed three singlet signals at  $\delta$  2.10, 3.45 and 4.00 ppm for  $\text{CH}_3$ ,  $\text{CH}_2$  and NHPH protons, multiplet signals at  $\delta$  7.36 -7.59 ppm for aromatic protons and singlet signal at  $\delta$  9.70 ppm for amidic NH proton. Also, its mass spectrum showed the molecular ion peak at  $m/z = 624$  ( $\text{M}^+$ , 60%) corresponding to the molecular formula  $\text{C}_{32}\text{H}_{28}\text{N}_6\text{O}_4\text{S}_2$ .

Refluxing of compound **11** in *N,N*-dimethylformamide in presence of catalytic amount of triethylamine gave the thiophene derivative **12** whose structure was confirmed by its alternative synthesis. Thus, refluxing of compound **3** with chloroacetone in a mixture of ethanol and *N,N*-dimethylformamide (2:1) in presence of catalytic amount of triethylamine afforded the thiophene derivative **12** in reasonably good yield. The structure **12** was established based on its IR spectrum that showed bands at 3270, 2191, 1743 and 1660  $\text{cm}^{-1}$  related to NH, CN,  $\text{COCH}_3$  and CONH function groups, respectively. The  $^1\text{H NMR}$  spectrum of the thiophene derivative **12** revealed two singlet signals at  $\delta$  2.50 and 7.11 ppm for  $\text{CH}_3$  and  $\text{NH}_2$  protons, multiplet signals at  $\delta$  7.36-7.63 ppm and two singlet signals at  $\delta$  9.72 and 9.78 ppm for PhNH and amidic NH protons. Also, its mass spectrum showed the molecular ion peak at  $m/z = 624$  ( $\text{M}^+$ , 70%) corresponding to the molecular formula  $\text{C}_{32}\text{H}_{28}\text{N}_6\text{O}_4\text{S}_2$  (Scheme 5).

When the intermediate sodium salt **2** stirred with 1,3-dibromopropane in *N,N*-dimethylformamide at room temperature in alcoholic potassium hydroxide, a product **13a** that analyzed for  $\text{C}_{29}\text{H}_{24}\text{N}_6\text{O}_2\text{S}_2$  was isolated in good yield. The structure **13a** was established based on its IR spectrum that showed bands at 3303, 3284, 2925, 2192 and 1660  $\text{cm}^{-1}$  corresponding to NHPH, amidic NH,  $\text{CH}_2$ , CN and CO function groups, respectively. Its  $^1\text{H NMR}$  spectrum revealed multiplet signals at  $\delta$  1.72-1.93 ppm attributable to  $\text{CH}_2$  protons, triplet signal at  $\delta$  3.40 ppm for  $\text{CH}_2\text{S}$  protons, singlet signal at  $\delta$  3.68 ppm for NHPH proton, multiplet signals at  $\delta$  7.21-7.55 ppm for aromatic protons and singlet signal at  $\delta$  9.56 ppm for amidic NH proton. The structure of compound **13a** was confirmed by its mass spectrum which showed a peak at  $m/z = 558$  ( $\text{M}^+$ +6, 90%).

Similarly, when the intermediate **2** was stirred with 1,4-dibromobutane in *N,N*-dimethylformamide at room temperature in alcoholic potassium hydroxide, a product **13b** that analyzed for  $\text{C}_{30}\text{H}_{26}\text{N}_6\text{O}_2\text{S}_2$  was isolated in good yield. The structure **13b** was established based on its IR spectrum that showed bands at 3280, 2927, 2194 and 1631  $\text{cm}^{-1}$  related to NH,  $\text{CH}_2$ , CN and CO function groups, respectively. Its  $^1\text{H NMR}$  spectrum revealed multiplet signals at  $\delta$  1.52-1.75 ppm attributable to  $\text{CH}_2$  protons, triplet signal at  $\delta$  3.40 ppm for  $\text{CH}_2\text{S}$  protons, singlet signal at  $\delta$  4.10 ppm for NHPH proton, multiplet signals at  $\delta$  7.23-7.43 ppm for aromatic protons and singlet signal at  $\delta$  9.41 ppm for amidic NH proton. The structure of compound **13b** was confirmed by its mass spectrum which showed a peak at  $m/z = 569$  ( $\text{M}^+$ +3, 89%).

Moreover, the intermediate **2** when reacted with 1,2-bis(bromomethyl)benzene in stirring *N,N*-dimethylformamide at room temperature in alcoholic potassium hydroxide, a product **14** that analyzed for  $\text{C}_{34}\text{H}_{26}\text{N}_6\text{O}_2\text{S}_2$  was isolated in good yield. The structure **14** was established based on its IR spectrum that showed bands at 3401, 3259, 2925, 2192 and 1660  $\text{cm}^{-1}$  due to NHPH, amidic NH,  $\text{CH}_2$ , CN and CO function groups, respectively. Its  $^1\text{H NMR}$  spectrum revealed a singlet signal at  $\delta$  3.86 ppm attributable to  $\text{CH}_2\text{S}$  protons, multiplet signals at  $\delta$  7.14-7.40 ppm for aromatic protons and two singlet signals at  $\delta$  9.51 and 11.65 ppm for NHPH, amidic NH protons. Its mass spectrum showed a peak at  $m/z = 614$  ( $\text{M}^+$ , 91%).

In addition to that mentioned above, refluxing the intermediate **2** with 6-chloro-2,4-diamino pyrimidine in a mixture of *N,N*-dimethylformamide and acetone (1:2) in presence of potassium carbonate yielded a product **15**, which analyzed correctly for  $\text{C}_{34}\text{H}_{28}\text{N}_{14}\text{O}_2\text{S}_2$ . The structure **15** was inferred from its spectral data. Thus, IR spectrum showed absorption bands at 3397, 3315, 3282, 3195, 2192 and 1644  $\text{cm}^{-1}$  corresponding to two  $\text{NH}_2$ , NHPH, amidic NH, CN and CO functions, respectively. Its mass spectrum showed a peak at  $m/z = 724$  ( $\text{M}^+$ +4, 73%) (Scheme 6).

### 3.2. Antimicrobial activity

Fifteen of newly synthesized target compounds were evaluated for their *in vitro* antibacterial activity against *Bacillus subtilis* and *Bacillus thuringiensis* as example of Gram-positive bacteria and *Escherichia coli* and *Pseudomonas aeruginosa* as examples of Gram-negative bacteria. They were also evaluated for their *in vitro* antifungal potential against *Fusarium oxysporum* and *Botrytis fabae* fungal strains.

Agar-diffusion method was used for the determination of the preliminary antibacterial and antifungal activity. Chloramphenicol, cephalothin and cycloheximide were used as reference drugs. The results were recorded for each tested compound as the average diameter of inhibition zones (IZ) of bacterial or fungal growth around the disks in mm. The minimum inhibitory concentration (MIC) measurement was determined for compounds showed significant growth inhibition zones (>14 mm) using two fold serial dilution method [24]. The MIC ( $\mu\text{g/mL}$ ) and inhibition zone diameters values are recorded in Table 1.

The results depicted in Table 1 revealed that the most of tested compounds displayed variable inhibitory effects on the growth of the tested Gram-positive and Gram-negative bacterial strains, and also against antifungal strain. In general most of the tested compounds revealed better activity against the Gram-positive rather than the Gram-negative bacteria.

Regarding the structure-activity relationship of the thiazoles derivatives against Gram-positive bacteria, the results revealed that compounds **4**, **7**, **14** and **15** exhibited broad spectrum antibacterial profile against the tested organisms. Thiazoles derivatives **4** and **7** recorded higher activity than thiophene derivative **12**. In this view, compounds **4**, **7**, **14**, and **15** were equipotent to chloramphenicol in inhibiting the growth of *B. subtilis* (MIC 3.125  $\mu\text{g/mL}$ ), while its activity was 50% lower than of chloramphenicol against *B. thuringiensis*. Compound **12** showed 50% of the activity of chloramphenicol (MIC 6.25  $\mu\text{g/mL}$ ) but it was equipotent to cephalothin in inhibiting the growth of *B. subtilis* and *B. thuringiensis* (MIC 6.25  $\mu\text{g/mL}$ ). On the other hand, compounds **1**, **3**, **5**, **6**, **8**, **9**, **11**, **13a** and **13b** exhibited moderate growth inhibitory activity against Gram-positive bacteria as revealed from their MIC values (6.25-50  $\mu\text{g/mL}$ ). Among these compounds **13a** and **13b** showed good growth inhibitory against *B. subtilis* (MIC 6.25  $\mu\text{g/mL}$ ), while compounds **5**, **6**, **8**, **9** and **11** showed relatively good growth inhibitory profiles against *B. subtilis* (MIC 12.5  $\mu\text{g/mL}$ ) which were about 25% of the activity chloramphenicol and 50% cephalothin against the same organism.

**Table 1.** Minimal inhibitory concentration (MIC,  $\mu\text{g/mL}$ ) and inhibition zone (mm) of some new synthesized compounds\*.

Compound no	MIC in $\mu\text{g/mL}$ , and inhibition (mm)					
	Bacteria				Fungi	
	Gram-positive bacteria		Gram-negative bacteria			
	<i>B. subtilis</i>	<i>B. thuringiensis</i>	<i>E. coli</i>	<i>P. aeruginosa</i>	<i>F. oxysporum</i>	<i>B. fabae</i>
1	50 (18)	50 (14)	100 (15)	50 (19)	100 (16)	50 (18)
3	25 (27)	50 (15)	100 (15)	100 (16)	50 (19)	100 (16)
4	3.125 (45)	6.25 (38)	25 (25)	12.5 (33)	100 (16)	25 (27)
5	12.5 (33)	50 (14)	50 (20)	50 (19)	12.5 (33)	50 (20)
6	12.5 (32)	50 (20)	100 (15)	100 (15)	25 (25)	100 (16)
7	3.125 (44)	6.25 (37)	100 (14)	50 (20)	6.25 (38)	6.25 (19)
8	12.5 (32)	50 (20)	100 (15)	100 (15)	25 (25)	100 (16)
9	12.5 (32)	50 (15)	100 (15)	100 (16)	50 (19)	50 (20)
10	6.25 (38)	6.25 (30)	100 (14)	100 (15)	100 (16)	100 (16)
11	12.5 (32)	6.25 (38)	100 (15)	50 (19)	100 (15)	100 (15)
12	6.25 (37)	6.25 (37)	100 (15)	100 (15)	12.5 (33)	12.5 (32)
13a	6.25 (38)	6.25 (37)	100 (15)	50 (19)	100 (15)	100 (16)
13b	6.25 (38)	6.25 (37)	100 (15)	50 (19)	100 (15)	100 (16)
14	3.125 (40)	6.25 (37)	100 (15)	50 (19)	100 (15)	100 (16)
15	3.125 (41)	6.25 (38)	100 (15)	50 (19)	100 (15)	100 (16)
Chloramphenicol	3.125 (44)	3.125 (44)	6.25 (37)	6.25 (38)	NT	NT
Cephalothin	6.25 (36)	6.25 (37)	6.25 (38)	6.25 (37)	NT	NT
Cycloheximide	NT	NT	NT	NT	3.125 (43)	3.125 (42)

\* MIC: Minimal inhibitory concentration values with SEM = 0.02 (The lowest concentration that inhibited the bacterial growth); NT: Not tested.

Concerning the antibacterial activity of the compound **5** revealed weak growth inhibitory against the tested Gram-negative bacteria (MIC 50  $\mu\text{g/mL}$ ).

Regarding the activity of thiazole derivatives, against antifungal strains, the results revealed that compound **7** was 50% lower than cycloheximide inhibitory the growth of *B. fabae* and *F. oxysporum* (MIC 6.25  $\mu\text{g/mL}$ ), while the activity of compound **5** and **12** were 25% lower than cycloheximide against *F. oxysporum* (MIC 12.5  $\mu\text{g/mL}$ ).

The substituted pattern was also crucial. It is worth mentioning that formation of cyclic bisulphide and thiazole derivatives produced a high antimicrobial activity. On the other hand, conversion of thiocarbonyl derivative **3** to **5**, **6**, **8**, **9** and **11** unfortunately produced weak antimicrobial activity.

The tested compounds were more active against Gram-positive than Gram-negative bacteria, it may be concluded that the antimicrobial activity of the compounds is related to cell wall structure of the bacteria. It is possible because the cell wall is essential to survival of bacteria and some antibiotics are able to kill bacteria by inhibiting a step in the synthesis of peptidoglycan. Gram-positive bacteria possess a thick cell wall containing many layers of peptidoglycan and teichoic acids, but in contrast, Gram-negative bacteria have a relatively thin cell wall consisting of a few layers of peptidoglycan surrounded by a second lipid membrane containing lipopolysaccharides and lipoproteins. These differences in cell wall structure can produce differences in antibacterial susceptibility and some antibiotics can kill only Gram-positive bacteria and are inactive against Gram-negative pathogens [25].

#### 4. Conclusion

The present study describes the synthesis and investigates the antimicrobial activities of some new functionalized thiazoles, thiophene and cyclic dithio derivatives with the hope of discovering new structure leads serving as antimicrobial agents.
